SNAPSERVE | BUSINESS INTRODUCTION

An AI telecaller for your market, including African languages

A short briefing for operators who want to run professional outbound and inbound phone campaigns without standing up a full call-centre floor first.

What SnapServe is

SnapServe is software that runs an **AI voice agent on the phone** - like a well-trained telecaller who can work all day, in the caller's language.

It can call your customers, or answer when they call you. It speaks naturally - not a robot menu of "press 1". It can book appointments, answer common questions, collect details, and follow up on payments. After the call it can send a **WhatsApp** or email, and write the result into a spreadsheet or your CRM.

You do not hire a call-centre floor to start. You set up one agent, give it your script and your data, and it dials.

How a call works (no jargon)

The person talks. SnapServe turns speech into text. The AI decides what to say or do (book a slot, send WhatsApp, transfer to a human, end the call). It speaks back on the same phone line. You can listen to recordings and see what happened after each call.

Global, including Africa

This is not India-only. The same platform can sit on local or international phone numbers (Nigeria, Kenya, Ghana, South Africa, Tanzania, and others) through global carriers. WhatsApp matters as much as the phone in Africa - SnapServe already does mid-call and post-call WhatsApp, not only voice.

Market	What we can run today
English (Nigeria, Kenya, Ghana, South Africa, Tanzania)	Strong. Easiest first launch.
French (West / Central Africa)	Strong.
Arabic (North Africa)	Strong.
Portuguese (Angola, Mozambique)	Strong.
Swahili, Hausa, Yoruba, Zulu, Afrikaans, Amharic, Somali, and several others	Available on our Gemini Live voice path (the model hears and speaks the language directly).
Igbo, Xhosa, Lingala, and some others	We can list them, but quality must be tested on a live number before you sell it as production.

How we would implement it with you

- **1. Pick one country and one job.** Example: Kenya - English + Swahili, callback after a website form. Or Nigeria - English + Hausa/Yoruba, appointment reminder.
- **2. Get a local number** and confirm calling rules (consent, DND, POPIA in South Africa, NDPR in Nigeria, and similar).

- **3. Write the agent once:** who you are, what you sell, what you must never promise, when to transfer to a human.
- **4. Connect your list:** CSV, Google Sheet, or website form. SnapServe dials.
- **5. Pilot 100-500 calls.** Listen to recordings, fix the script, then scale.
- **6. Add WhatsApp** so the customer gets a message after the call (booking, link, summary).

A first live pilot is usually days, not months, if the use case is clear.

What we would not claim

SnapServe was built first for India (Hindi, Tamil, Telugu, and other Indian languages on the phone). That is why the voice quality there is very strong. For Africa we use the global voice stack, and we should prove Swahili / Hausa / Yoruba on **your** numbers before a big campaign. English, French, and Arabic we can start with more confidence.

Suggested next step. A 15-minute live demo: you call a number, talk to the agent in English (and Swahili or French if you want), and we walk through how it would sit in your business. Start with one country and one campaign.
